

Ecography

ECOG-01163

Anadón, J. D., Graciá, E., Botella, F., Giménez, A., Fahd, S. and Fritz, U. 2015. Individualistic response to past climate changes: niche differentiation promotes diverging quaternary range dynamics in the subspecies of *Testudo graeca*. – Ecography doi: 10.1111/ecog.01163

Supplementary material

790 **Appendix 1. Additional tables and figures.**

791

792 **Table A1.**

793 North African samples of *Testudo graeca* whose Cytochrome *b* sequences were
 794 downloaded from GenBank. Geographic information was taken from previous works or
 795 in the case of sequences from works pending publication was directly provided by the
 796 authors. GenCODE refers to voucher samples in the collections of the Museum of
 797 Zoology Dresden (MZD) or Miguel Hernandez University (MHU).

798

802

817
818 **Figure A1.** Consensus predictive distribution maps of the five subspecies of *T. graeca*
819 in North Africa for the present time and the Last Glacial Maxima. Colder colors indicate
820 low probability values of presence and warmer colors indicate high probability of
821 presence. Areas in grey indicates non-analogous climates. The distribution of non-
822 analogous climates was comprised by identified as those pixels where the difference
823 between prediction values with and without clamping as assessed by Maxent is less than
824 0.05. For each subspecies, the polygon on continuous line indicates the area enclosing
825 location records assigned to the subspecies. Polygon on dotted line indicates the buffer
826 are employed as training area for drawing pseudoabsences in Maxent (see Methods).
827

828

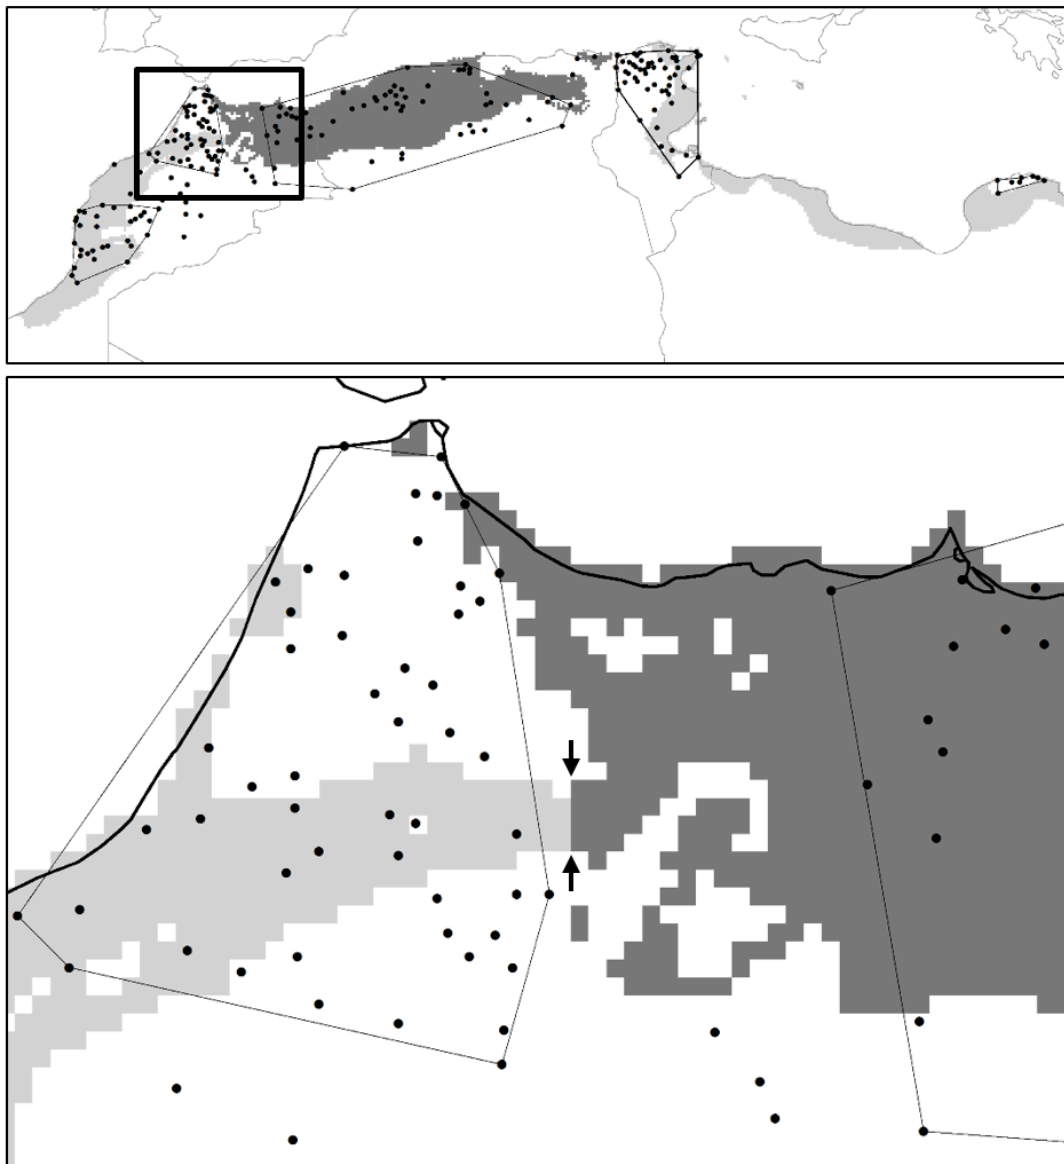

829 **Figure A2.** Response of the five subspecies of *T. graeca* to precipitation in the coldest
830 quarter (PCOLD_q) in mm. The curves show the mean response of the 100 replicate
831 Maxent runs and the mean +/- one standard deviation (grey).
832

833

834

835 **Figure A3.** Delimitation between occupied and unoccupied suitable patches for *T. g.*
836 *graeca* in the present time. Top: Occupied and unoccupied suitable patches for *T. g.*
837 *graeca* in the entire study area. Bottom: Detail of the contact zone between the occupied
838 and unoccupied suitable areas. The limit of the suitable patch was set at the line of
839 weakest connection (lowest number of connecting pixels) between the two patches.
840 Dark grey: occupied suitable patch, light grey=unoccupied suitable patch, black dots
841 =occurrence of *T. graeca* (species level), polygons= MCP delimiting occurrence data
842 assigned to a single subspecies (see Methods section and Fig. 1 for details), black
843 arrows= limit between the occupied and unoccupied suitable patch for *T. g. graeca*.
